HC2052

CMYK Characterization Target

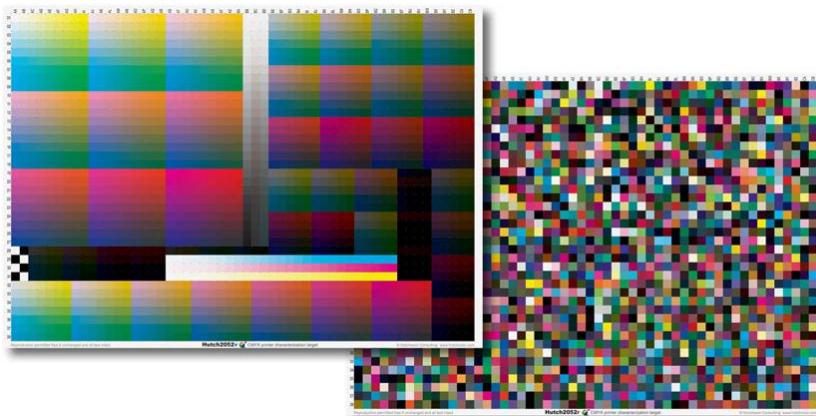

Introduction

The HC2052 is a CMYK printer characterization target designed to improve precision and accuracy in very demanding ICC profiling applications. The main differences between the HC2052 and the legacy standard IT8.7/4 target are more patches (the HC2052 is slightly larger) and better shadow characterization (the HC2052 is noticeably darker overall).

HC2052 vs. IT8.7/4 showing differences in size and average darkness

The default HC2052 target is extracted from a larger “mother-set” of patches from which additional companion targets can also be printed (if needed) to increase precision in shadows, highlights or the whole color space. In the context of the mother-set, the default HC2052 is a minimalist target, optimized for general use.

Default HC2052 target layouts – visual (left) and randomized (right)

Beta User Feedback

Beta users consistently report improved shadow detail and smaller average and peak Delta E errors (especially in saturated colors) when the HC2052 is used instead of the IT8.7/4 to characterize a wide-gamut or high dynamic range proofing device, and the proofer is then used to simulate GRACoL or SWOP.

Theoretical Benefits (Compared to IT8.7/4)

- Closer spacing of high percentage values improves characterization of dark, saturated colors.
- More black ink levels (7 vs. 5) improves characterization of complex 4-color overprints.
- Floating point vs. integer percentages improve highlight and gray balance patches.
- Non-equal, function-based values increase end-point precision while minimizing target size and reducing risk of interpolation errors.
- Extensible with companion targets from a larger master patch set.

Theoretical Limitations

- Slightly larger than the current IT8.7/4 (2052 vs 1617 patches).
- Does not contain all the legacy IT8.7/3 or IT8.7/4 patch values.
- Fractional (non-integer) percentage values may challenge older profiling software.

Goals and Design Logic

- The HC2052 overcomes the IT8.7/4's sampling limitations in darker tones and saturated colors when used on high dynamic-range, wide-gamut printing systems.
- Rather than expand the IT8.7/4 target patch set, the HC2052 design takes the more spatially-efficient approach of a completely new design.
- To facilitate calibration (near-neutral or TVI) and characterization from a single target, and to improve near-neutral characterization, precision scales of TR015-based gray triplets as well as high-precision single-ink scales are included.
- Tone values are non-uniformly distributed to improve sampling frequency in darker or high percentage regions while minimizing the total number of patches.
- Patch values are distributed smoothly using an open function that allows profiling software to accurately interpolate between actual printed patches.
- All CMYK percentages are calculated with floating point precision to eliminate unnecessary limitations at the design stage. Rounded values with as few as two decimal places should produce excellent results in practice.
- The relatively wider spacing between light-tone patches than dark-tone patches assumes the target will be printed after a prior calibration step that "linearizes" performance in lighter tones. Without pre-calibration the optimality of this (or any other) minimalist characterization target may be reduced.
- The default 1-page target is part of a much larger "mother set" of patches calculated by identical functions. To improve characterization accuracy in specific tonal areas

(for example highlights or shadows) one or more companion targets from the mother set can be printed as well as the default target.

HC2052 Versions

The last letter in the target name, (HC2052D, HC2052E, HC2052F, etc.) indicates a unique change in patch values and/or distribution curves. *At the time of writing the latest version is the HC2052F.*

NOTE: The reference file used to measure the HC2052 **MUST** match the letter code of the printed target.

Target Value Generation

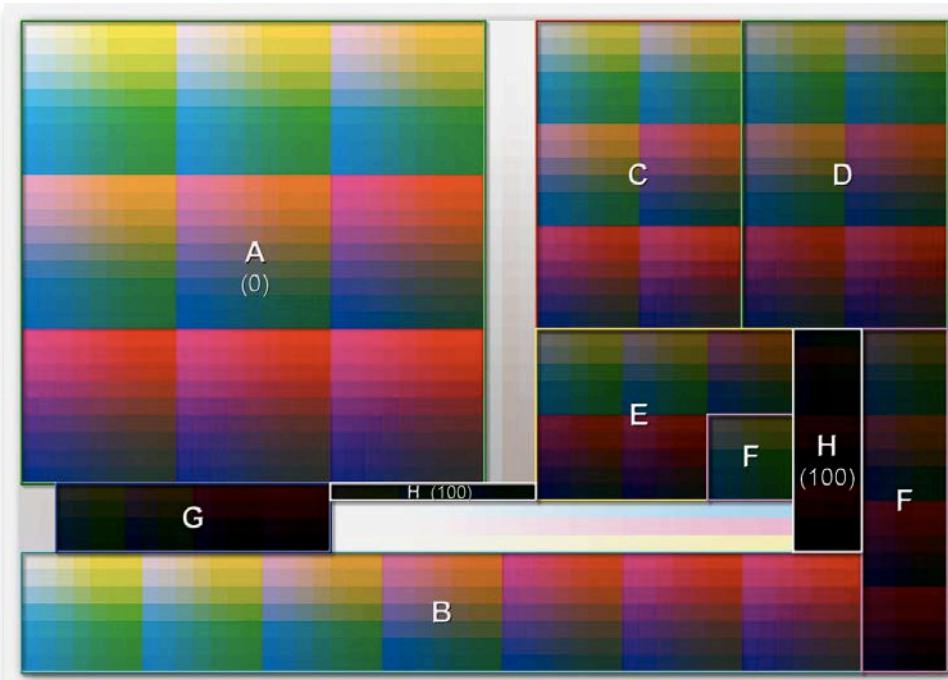

The HC2052F consists of a conventional 4-dimensional characterization array (nominally 1,882 patches) generated in Microsoft Excel by a non-proprietary algorithm, plus 170 pre-defined patches unaffected by the generation algorithm.

The 4-dimensional array can be adjusted to modify...

- The number of black values
- The number of CMY values at each black value
- The non-linear distribution of black values between 0% and 100%
- The non-linear distribution of CMY values at each black value

Black Percentage Values

The default HC2052F has 8 black percentage levels including 0 and 100%.

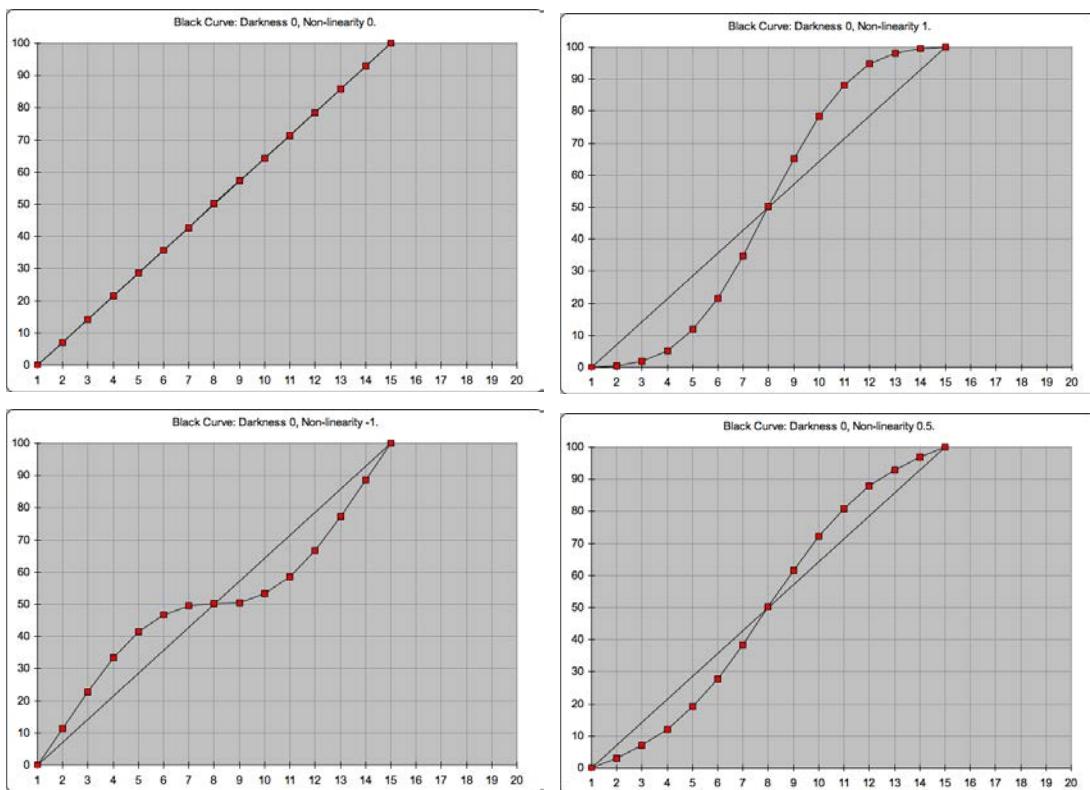

Black percentage value regions in the default HC2052 visual layout

Patch Value Generation

The distribution of Black values throughout the percentage domain is controlled by two main target generation variables governing “Non-linearity” and “Darkness”. (Similar variables control the distribution of CMY values at each Black value.)

Non-linear S-Curve Control

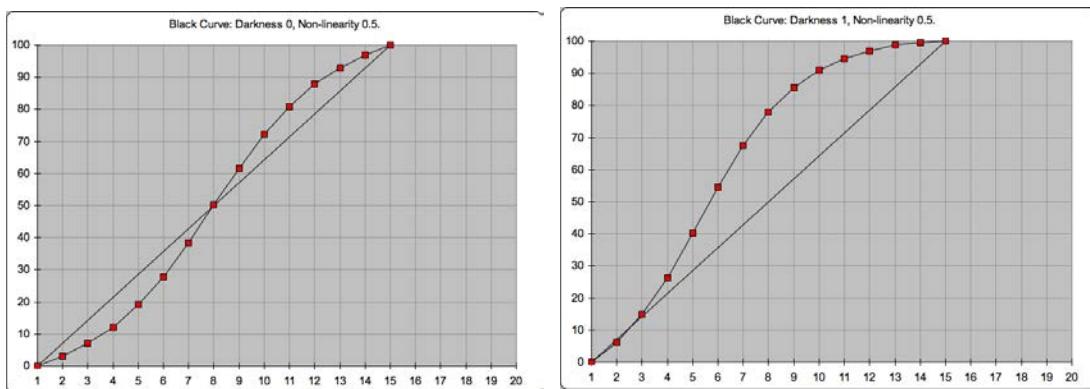

“Non-linearity” numbers between -1 and +1 adjust the percentage value spacing of both CMY and K to form either a straight line, an “S” curve” or a “reverse-S” curve. A non-linearity number of 0 distributes the values with equal spacing in a straight-line graph. A number of +1.0 distributes the values on an “S” curve with closer spacing at each end, while a number of -1 distributes the values on a “reverse-S” curve with closer spacing in mid-tones.

Non-linearity numbers of 0.0 (top left), +1.0 (top right), -1.0 (bottom left) and +0.5 (bottom right)

Darkness Control

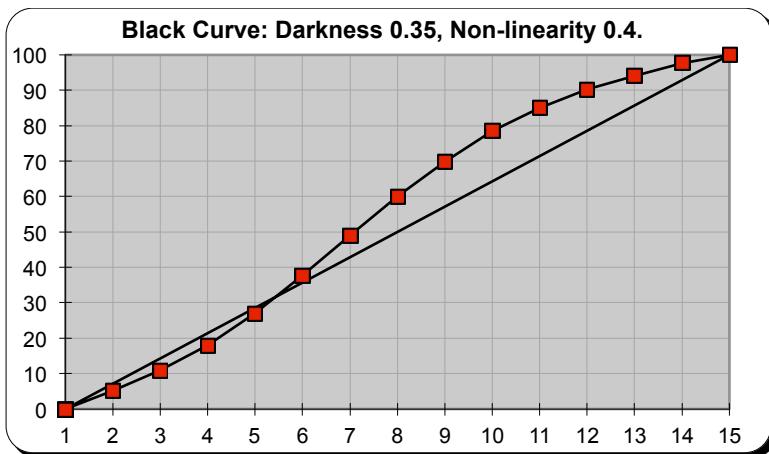

“Darkness” numbers between -1 and +1 adjust the average darkness or lightness of the patch value curves. A darkness of 0 distributes the S-curve values equally above and below a 50% average (below left), +1.0 darkens most of the S-curve values (below right), and -1.0 lightens most of the S-curve values (not shown).

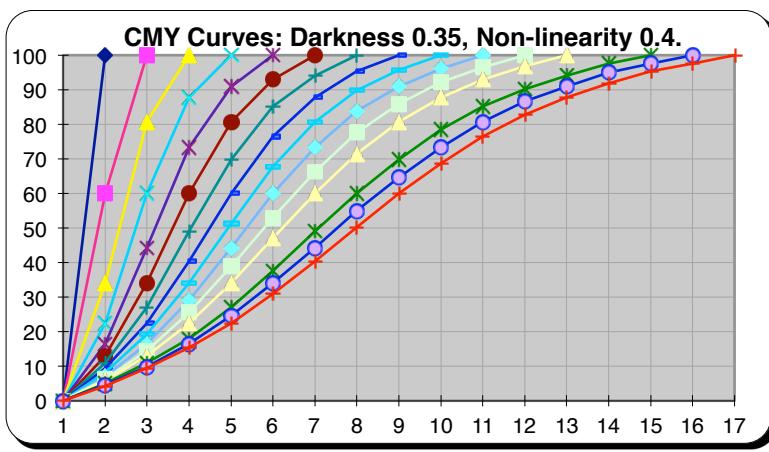

15-level black curve darkness 0.0 (left) and 1.0 (right) with non-linearity 0.5

Nominal HC2052F Patch Distribution

For the HC2052F target, Non-linearity is 0.4 and Darkness is 0.35 for K and CMY.

Black curve shape in the HC2052F. (Not all levels are used.)

CMY curve shapes in the HC2052F. (Not all levels or curves are used.)

The actual values in the HC2052F 4-D array are listed below.

K %	CMY steps per K step							
	0	10.98039	27.05882	49.01961	69.80392	85.09804	94.11765	100
1	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00
2	9.41	12.94	16.47	16.47	22.35	22.35	34.12	34.12

6	76.47	92.94	100.00	100.00				
7	87.84	100.00						
8	95.29							
9	100.00							

CMY percentage values for each K percentage in the HC2052F.

Note: these values are extracted from a larger *Mother Set* shown in **Appendix B:**

Additional 170 Patches

The 170 extra patch values in the default HC2052 target are listed in **Appendix A:** and consist of:

- Four 27-step ramps (0-100%) of C, M, Y and K
- One 3-color gray-balanced CMY ramp (0-300%)
- One 3-color equal CMY (C=M=Y) ramp (0-300%)
- Eight close-spaced variations of a nominal 50c, 40m, 40y gray patch

Available Target Images

A beta package of target images, reference files and a user guide can be down-loaded from www.hutchcolor.com/Images_and_targets.html.

The package contains a selection of target images for X-Rite's iSis, DTP70 and i1iO.

Reference files are available for X-Rite's MeasureTool, ColorPort and i1Profiler.

User-Created Targets

Target images based on other layouts or devices may be generated in software such as X-Rite's MeasureTool and i1Profiler (version 1.5 or later). Earlier versions of i1Profiler and all versions of ColorPort should not be used due to a known bug that generates incorrect target patches from fractional percentages values.

Beta status

Any and all versions of the HC2052 target should be considered "in beta" and will probably remain so indefinitely or until such time as a particular version is adopted at some industry standards level.

Reference file accuracy

Note that percentage values are fractional (non-integer) and must be rounded to at least two decimal places, NOT truncated. Targets created from integer percentages (rounded or truncated) are “illegal”, defeat much of the value of the HC2052, and will produce inferior results compared to a “legal” HC2052.

Compatible software

At the time of writing the only profiling software tested successfully with the HC2052 are X-Rite ProfileMaker 5x and i1Profiler. Profiling software that cannot accept fractional percentages (e.g. MonacoPROFILER) will not work correctly.

Availability and Support

For several years the HC2052 target has been available free for public use at ... www.hutchcolor.com/Images_and_targets.html. The free status may be discontinued at any time without prior notice.

HutchColor, LLC offers NO SUPPORT to end-users unless they are HutchColor, LLC clients in good standing.

Copyright, IP and Public Adoption

Until further notice the HC2052 target patch values and layout(s) and the principles by which they are calculated are the exclusive intellectual property and copyright © of HutchColor, LLC, with all rights reserved. HutchColor is, in principle, willing to cede all copyrights and IP free of charge to CGATS or some other standards body to make this an official standard target, subject to further discussion.

Patch ID system

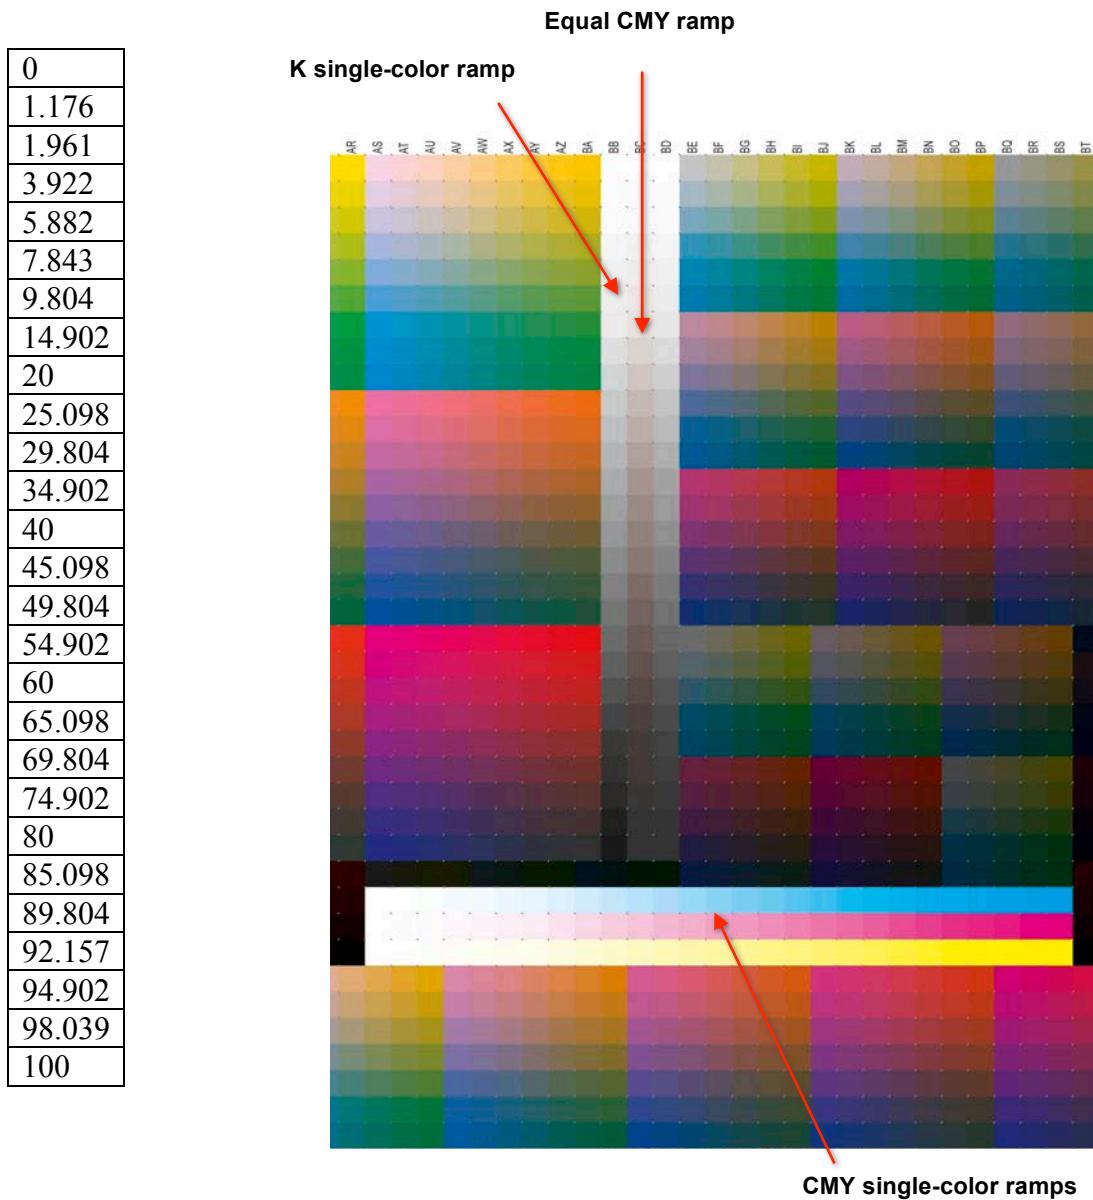

As currently available, reference files for the HC2052 may have different Sample ID and Sample Naming conventions depending on the device for which the reference file is formatted and the layout (Random or Visual).

Patches are identifiable uniquely only by their CMYK percentage values, not by the Sample ID or Sample Name in the reference files. Supporting software MUST take patch percentage values from the measurement file and should not rely on any layout assumptions.

If adopted by CGATS or another official body, a patch ID system may be added, but it is strongly suggested that any arbitrary patch ID system either be based on numeric CMYK percentage values, or be *subordinate to* patch value identification.

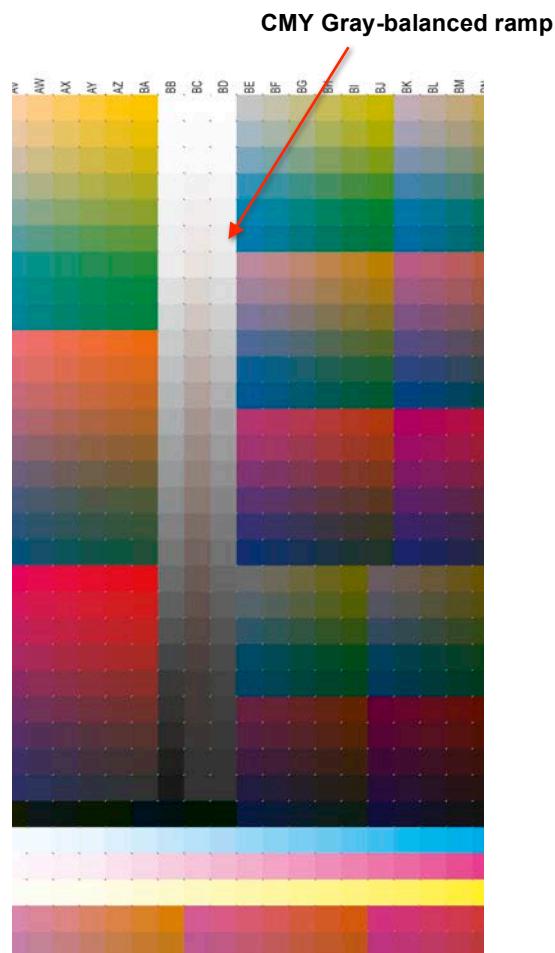

Appendix A: Extra 170 patch values

Single Color (CMYK) and Equal-CMY Ramp Values (Same percentage values for all colors)

Appendix B: HC2052F Mother Set

The following table shows the K values and CMY values (per K value) in the 20,684 *Mother Set* of patch values from which the default 1-page HC2052F target values (red) are drawn.

Note: Two decimal places are shown, but the actual Mother Set is calculated in full floating-point accuracy.

K %	CMY steps per K															
	0	5.098	10.980	18.039	27.059	37.647	49.019	60	69.804	78.432	85.098	90.196	94.118	97.647	100
